Install and initialize

Download the environment-modules package via the package manager. Initialize the package via the command (terminal):

```
add.modules
```

For details see the askubuntu article "module load" command does not work

To add a path with module files (e.g. /sw/modules) to the module search path of environment modules, you need to append the path the the MODULEPATH environment variable - e.g. in the .bashrc -:

```
export MODULEPATH="$MODULEPATH:/sw/modules"
```
